

StepUp

EVERY STEP. EVERY STRIDE. EVERY DAY.

Move-to-Earn, built **app-first, for the GIWA chain.**

V1.15.1 ANDROID SEOUL, KOREA GIWA SEPOLIA · 91342

Three failures, stacked on top of each other.

Fitness apps churn

A step counter has no reason to survive a broken streak.

M2E apps collapse

When emissions fall, DAU falls with them — because the token *was* the product.

Chains lose the funnel

Seed phrases and gas kill Web2 users before their first run.

**Every M2E cycle has ended the same way:
the token arrived first, the product never did.**

It wasn't the idea. It was the **multiplier ladder**.

- Earning scaled **5x-20x** with NFT spend → the game became a yield calculation
- Yield attracted capital, not runners
- Capital left when yield fell — and it took the DAU with it, because there was nothing else to open the app for

The failure mode is specific, and it is designable-around. Cap the multiplier and the token stops being an investment instrument.

App first. Token second.

And the multiplier ceiling is **+17.8%**, not 10x.

LAST CYCLE

up to ×20

STEPUP

×1.178

- **Delete the token and it is still a running app people use.**
- **Capital cannot outrun legs.** The best possible sneaker earns +17.8% per step over a free one.
- **No wallet in the new-user funnel.** SUP is earned and spent locally from second one.

Not a mockup. An installable APK, today.

RUNNER LEVELS

Real device captures, not renders. Install the APK, or run `./gradlew :app:testDebugUnitTest`.

THE RUN SCREEN

Real GPS. Real course. Real laps.

- Foreground service (health|location) — survives screen-off and app switching
- Haversine distance, track simplification, $\cos(\text{latitude})$ -corrected normalization
- Live GPS trace drawn over the selected course on a neon map
- **9 live metrics** — pace, lap split, HR, cadence, kcal, steps, speed, elevation, ETA
- Laps: automatic every kilometre + manual button

Record a run. Publish it as a course.

- Record a run → save the GPS track as a reusable course
- Publish it → other runners take it, like it, run it
- Completion reward = **km × 1.0 SUP**, capped at 42, paid at **≥98% GPS-verified**

Fully deterministic. No random roll, no loot box. The same 5 km course pays 5.0 SUP to everyone who finishes it, always.

A reward a user can compute in advance is a reward they can trust.

Retention is social, not monetary.

- **Party run** — ready-check → 3·2·1 → synchronized measurement → **+10% per crew member**, max +50%
- **Flash-run (번개러닝)** — meeting point opens in Google Maps, live capacity, proximity-sorted board
- Threaded replies with notifications, crew-only boards, three ranking boards

**The token rewards the run.
The crew is why you show up.**

4 factions × 11 variants = 44 designs

RARITY	MINT ODDS	MAX BOOST	MAX LEVEL
Common	55%	+5.1%	10
Rare	28%	+8.6%	15
Epic	13%	+12.1%	20
Legendary	4%	+17.8%	30

Sneaker **level** raises the daily cap on rewardable steps (6,000 → 40,800), not the per-step rate. Raising the cap is worthless unless you can physically walk into it.

Every SUP is paid for with measured physical effort.

$$\text{payout} = \text{rewardedSteps} \times 0.01 \times \text{sneaker} \times \text{party} \times \text{booster}$$

Accrual	0.01 SUP/step, only during an active run session
Gate	Energy: 1 cell = 600 steps, midnight refill. At 0, accrual stops entirely
Multipliers	sneaker ×1.000–×1.178 · party ×1.0–×1.50 · booster ×2.0 (bought for 200 SUP)
Bonuses	daily goal 20–34 SUP · course completion km × 1.0, cap 42

Background steps don't pay. Walking to the fridge doesn't pay. Each session produces exactly one auditable (steps, distance, boost, payout) record.

One year, three personas.

	CASUAL	COMMITTED	ELITE
Session steps/day	4,000	10,000	18,000
Total in	22,300	52,400	89,400
Total out	5,000	30,750	103,625
Net	+17,300	+21,650	-14,225

Net-emissive at the bottom, net-deflationary at the top — by design. New users must accumulate something for the loop to be worth starting; the players with the most SUP must have somewhere expensive to put it.

We don't claim sinks alone close the loop. They compress it. The on-chain emission budget closes it.

Two layers, one token.

In-app SUP — off-chain ledger, earned per step, burned on mint/upgrade/boost. Live today. Most SUP never touches the chain.

On-chain SUP — ERC-20, claimed through the distributor, bounded by a global daily budget that **halves every 730 days**.

$$\text{rate}(d) = \min(1, B(d) / \sum \text{claimScore}(d))$$

Supply cannot hyperinflate no matter how many users join — the budget is fixed before the users are counted.

CONTRACT	ROLE
SUPToken	ERC-20, 1B hard cap, no mint function after deploy
SneakerNFT	ERC-721, stats on-chain, art on IPFS
RewardDistributor	Signed run proof, replay-protected claim, applies rate(d). No withdraw, sweep or rescue
CourseRegistry	Publicly verifiable course authorship

What ships, what doesn't.

LAYER	TODAY	NEXT
Client	SHIPPED installable APK	—
Contracts	DEPLOYED GIWA Sepolia, 43 tests passing	Mainnet + external audit
SUP	DEPLOYED 1B fixed, 50M in the pool	App claims against it
Settlement	LOCAL on-device RewardEconomy	RewardDistributor
Wallet	NOT YET ledger + withdrawal UX only	Connect + claim
Attester	NOT YET written, 7 tests passing	Deploy

The contracts are on chain. The app is not connected to them yet, and we are not claiming otherwise. What's missing is the wallet-connect and claim path, and deploying the attester.

Traditional-finance veterans moving into crypto.

Five people, Seoul.

ROLE	BACKGROUND	OWNS
CEO	Proprietary trader 2008–2018, securities & investment · Head of Asset Management	Reward-economy parameters
CIO	Proprietary trader 2006–2018 · Macro senior trader · Head of CTA Solutions	Emission schedule, treasury
Systems	Electronics engineering · System trader 2010–2018 · Investment advisory 2018–2022	Run proof, attester, anti-abuse
Community	Crypto KOL — Korean market audience & campaigns	Crews, growth, creator channels
Markets	Active crypto trading desk	On-chain liquidity

Most M2E economies were designed by product people, not by people who price risk. Ours was designed by traders. That is why the ceiling is **+17.8%** and why the tokenomics has a section called *"open questions we are not pretending to have solved."*

Names, affiliations and full CVs are supplied separately with the application.

THE ASK

Support to complete **M2 and M3.**

M2 · done

SUPToken, SneakerNFT, RewardDistributor, CourseRegistry deployed on GIWA Sepolia

M3 · next

Wallet connect + on-chain claim live in the app, with the attester running cadence and GPS plausibility checks

Everything else already works on-device. We are asking for support to put a reward loop that already runs onto GIWA.
